Date:

Control Statements in Java

Aim:

To understand and implement decision-making and looping control statements in Java.

PRE LAB EXERCISE

QUESTIONS

- ✓ **List different control statements in Java.**
Control statements in Java: Selection (if, if-else, switch), Iteration (for, while, do-while), and Jump (break, continue, return).
- ✓ **Difference between for, while, and do-while loops.**
Difference between for, while, and do-while: *for* is used when the number of iterations is known, *while* checks the condition before execution, and *do-while* executes at least once before checking the condition.
- ✓ **What is the use of break and continue?**
break exits the loop immediately, while *continue* skips the current iteration and moves to the next.

IN LAB EXERCISE

Objective:

To implement if-else and looping statements.

INPUT STATEMENT:

SCANNER CLASS

- ✓ The Scanner class in Java is used to read input from the user through the keyboard. It is available in the package java.util.
- ✓ The Scanner object reads different types of input such as integer, float, double, and string and stores them in variables.
- ✓ To use the Scanner class, it must be imported before using it in the program.

SYNTAX:

- ✓ `Scanner sc = new Scanner(System.in);`

Commonly Used Scanner Methods:

- ✓ nextInt() – reads an integer value
- ✓ nextFloat() – reads a float value
- ✓ nextDouble() – reads a double value
- ✓ next() – reads a single word
- ✓ nextLine() – reads a complete line of text

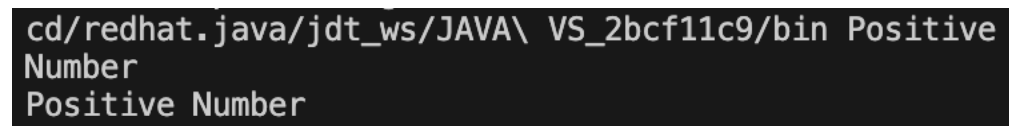

PROGRAMS:

Program 1: Check Whether a Number is Positive

```
class PositiveNumber {  
    public static void main(String[] args) {  
        int n = 5;  
        if (n > 0) {  
            System.out.println("Positive Number");  
        }  
    }  
}
```

Output:

Positive Number

```
cd/redhat.java/jdt_ws/JAVA\ VS_2bcf11c9/bin Positive  
Number  
Positive Number
```

Program 2: Check Whether a Number is Even or Odd

```
class EvenOdd {  
    public static void main(String[] args) {  
        int n = 6;  
        if (n % 2 == 0)  
            System.out.println("Even Number");  
        else  
            System.out.println("Odd Number");  
    }  
}
```

```
}  
}
```

Output:

Even Number

```
Even Number
```

Program 3: Find Largest of Two Numbers

```
class LargestTwo {  
    public static void main(String[] args) {  
        int a = 10, b = 20;  
        if (a > b)  
            System.out.println("A is largest");  
        else  
            System.out.println("B is largest");  
    }  
}
```

Output:

B is largest

```
B is largest
```

Program 4: Grade Calculation

```
class Grade {  
    public static void main(String[] args) {  
        int marks = 75;  
        if (marks >= 90)  
            System.out.println("Grade A");  
        else if (marks >= 75)  
            System.out.println("Grade B");  
    }  
}
```

```
else if (marks >= 50)
System.out.println("Grade C");
else
System.out.println("Fail");
}
}
```

Output:

Grade B

A screenshot of a terminal window with a dark background. The text "Grade B" is displayed in a light gray font.

Program 5: Day of the Week

```
class DaySwitch {
public static void main(String[] args) {
int day = 3;
switch (day) {
case 1: System.out.println("Monday"); break;
case 2: System.out.println("Tuesday"); break;
case 3: System.out.println("Wednesday"); break;
case 4: System.out.println("Thursday"); break;
case 5: System.out.println("Friday"); break;
default: System.out.println("Invalid Day");
}
}
}
```

Output:

Wednesday

A screenshot of a terminal window with a dark background. The text "Wednesday" is displayed in a light gray font.

Program 6: Print Numbers from 1 to 5

```
class ForLoop {  
    public static void main(String[] args) {  
        for (int i = 1; i <= 5; i++) {  
            System.out.println(i);  
        }  
    }  
}
```

Output:

1
2
3
4
5

A screenshot of a terminal window with a dark background. The output of the program is displayed as a vertical list of numbers: 1, 2, 3, 4, and 5, each on a new line.

Program 7: Print Numbers from 1 to 5

```
class WhileLoop {  
    public static void main(String[] args) {  
        int i = 1;  
        while (i <= 5) {  
            System.out.println(i);  
            i++;  
        }  
    }  
}
```

Output:

1

2

3

4

5

```
1
2
3
4
5
```

Program 8: Print Numbers from 1 to 5

```
class DoWhileLoop {
public static void main(String[] args) {
int i = 1;
do {
System.out.println(i);
i++;
} while (i <= 5);
}
}
```

Output:

1

2

3

4

5

```
1  
2  
3  
4  
5
```

Program 9: Sum of First 5 Natural Numbers

```
class SumNumbers {  
    public static void main(String[] args) {  
        int sum = 0;  
        for (int i = 1; i <= 5; i++) {  
            sum = sum + i;  
        }  
        System.out.println("Sum = " + sum);  
    }  
}
```

Output:

Sum = 15

```
cd /Users/santhoshkrishnaa/Downloads/VSCode/VSCode/bin - java -cp SumNumbers  
rs  
Sum = 15  
santhoshkrishnaa@santhoshs-MacBook-Air: JAVA_VS %
```

Program 10: Multiplication Table of a Number

```
class MultiplicationTable {  
    public static void main(String[] args) {  
        int n = 5;  
        for (int i = 1; i <= 10; i++) {  
            System.out.println(n + " x " + i + " = " + (n * i));  
        }  
    }  
}
```

Output:

$$5 \times 1 = 5$$

$$5 \times 2 = 10$$

$$5 \times 3 = 15$$

$$5 \times 4 = 20$$

$$5 \times 5 = 25$$

$$5 \times 6 = 30$$

$$5 \times 7 = 35$$

$$5 \times 8 = 40$$

$$5 \times 9 = 45$$

$$5 \times 10 = 50$$

```
5 x 1 = 5
5 x 2 = 10
5 x 3 = 15
5 x 4 = 20
5 x 5 = 25
5 x 6 = 30
5 x 7 = 35
5 x 8 = 40
5 x 9 = 45
5 x 10 = 50
```

POST LAB EXERCISE

✓ **What is the use of if statement?**

Use of if statement: It is used to execute a block of code only when a specified condition is true.

✓ **Difference between if-else and else-if ladder.**

Difference between if-else and else-if ladder: *if-else* chooses between two options, while an *else-if ladder* checks multiple conditions sequentially

✓ **Why is switch statement used?**

It is used to select one execution path from many based on a single variable's value.

✓ **Difference between for, while, and do-while loops.**

for is used when the number of iterations is known, *while* when it is unknown, and *do-while* executes the loop body at least once.

- ✓ **Which loop executes at least once?**
The do-while loop executes at least once

Result:

Thus the different control statements were executed successfully with expected output.
